**Art Unit: 1615** 

Applicant please note that claims 19 to 24 were inadvertently omitted in the previous office action. Receipt is made of the Amendment, Statement under 37 CFR 373 (b), Revocation and Power of Attorney of 7/14/04. Claims 19-30 are now pending Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 19-30 are rejected under 35 U.S.C. 102(b) as being anticipated by Okada et al. (U.S. patent No. 4,454,161).

Okada teaches a branched glucose polymer and a method for producing a branched glucose polymer by reacting an amylaceous substance with a branching enzyme, by means of conversion of an alpha-1,4-glucan into alpha-1,6 by branching in order to produce a structure similar to that of glycogen or an amylopectin (col.1, lines 10-15, at lines 36-39, and at lines 64-68, bridging col.2, lines 1-4), and thereby to enhance the qualities of the food products into which they are incorporated and, in particular, to prevent retrogradation of the amylaceous material in these food products. Okada teaches that the branching enzyme can come from animal, plant or microorganism sources (col.1, lines 52-56). Okada teaches that a solution of an amylaceous substance, such as starch, amylose or amylopectin, prepared by gelatinization and dispersion, is thus exposed to the branching enzyme, and is then

**Art Unit: 1615** 

mixed with the desired food products, without first undergoing any other treatment or, if necessary, after concentration and drying (col.2, lines 11-16).

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 19-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okada '161.

Although Okada is silent with respect to the teaching of the particular amounts, the parameters however, are merely descriptive.

There is no patentable distinction over the prior art teachings of the same composition having the same properties. Okada teaches the same debranching enzyme and starch.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the teachings of Okada, because Okada teaches branched glucose polymers and a method of producing the polymer, which is known for the purpose of preventing retrogradation of amylaceous substances in food products.

The expected result would be to prevent retrogradation of the amylaceous material in food products, thereby enhancing the quality of the food product.
